

# Computational Molecular Biology: Sources and Methods for Sequence Analysis

An overview of the field of computing applied to protein and nucleic acid sequences is presented in this book. Making accessible a broad range of essential information and scientific discovery, the author describes what data are available, what calculations can be performed, how to gain access to data and necessary programs, and how to intelligently and cautiously interpret results of the calculations.

Computational molecular biology can be divided into two broad areas: 1. methods based on the analysis of sequences of amino acid residues or nucleotides Consequently, EST data generated by conventional sequencing techniques have may add significant challenges to the computational methods for EST analysis. However, such EST-to-source mapping is not a readily available information **Article Reference - Archive ouverte UNIGE**
