

## A Bugs-Eye View of Flowers: The Micro Photography of Dr. Gary Greenberg

Have you ever wondered what it would look like if you were a tiny insect exploring the inside of a flower for sweet nectar? A Bugs-Eye View of Flowers by Dr. Gary Greenberg will give you a good idea of what that world looks like. Using his patented 3D microscopes, he creates spectacular images of the floral playgrounds that insects experience. Magnified up to 300 times, the intricate beauty of the petals, pistils, and stamens appear as beautiful miniature Disneylands of color, texture and design. Dr. Greenberg's unique 21st century microscope technology reveals the secret beauty of floral anatomy as never before seen by human eyes. This 104 page paperback book is illustrated with 80 pages of magnificent, super close up, color photographs of flowers under the microscope. Dr. Greenberg explains these amazing photographs, shedding light on the art and science of flowering plants. Artist, scientist, and inventor, Dr. Gary Greenberg, uses his patented 3D microscopes to create spectacular images of worlds beyond our everyday perception - worlds where reality is seen as abstract form and color, motion and texture. The secrets of nature are visible everywhere; yet, they remain secrets until they are revealed by artists and scientists. For Greenberg, art and science create doorways through which we can embrace nature more deeply. His mission is to reveal the secret beauty of the microscopic landscapes of our everyday world. Greenberg shows us that the miracles of nature are tangible, and they can be seen directly through the microscope.
