

# Some Problems in Linear Graph Theory That Arise in the Analysis of the Sequencing of Jobs Through Machines (Classic Reprint)

Excerpt from Some Problems in Linear Graph Theory That Arise in the Analysis of the Sequencing of Jobs Through Machines

A schedule is constructed from the technological ordering graphs by connecting the nodes for each machine station in a fashion which describes the order of the jobs through the machine station. For example, in figure 2 we have a schedule graph. Machine station 2 processes Job 5, then Job 4 then Job 2, and finally Job 1. As is well known, not every schedule graph is feasible, i.e. In the terminology of Akers and Friedman[1] the schedule graph does not contain loops or in the linear graph terminology the schedule graph is transitive. One of the problems that we study in detail is the construction and counting of transitive schedule graphs. A second problem in the sequencing of Jobs through machines is the construction of best schedules. The best schedule is one which minimizes some defined function over the set of all feasible schedule graphs. The function we study is the schedule time: it is a function of the feasible schedule graph and the given processing times of each Job at each machine station. About the Publisher Forgotten Books publishes hundreds of thousands of rare and classic books. Find more at [www.forgottenbooks.com](http://www.forgottenbooks.com) This book is a reproduction of an important historical work. Forgotten Books uses state-of-the-art technology to digitally reconstruct the work, preserving the original format whilst repairing imperfections present in the aged copy. In rare cases, an imperfection in the original, such as a blemish or missing page, may be replicated in our edition. We do, however, repair the vast majority of imperfections successfully; any imperfections that remain are intentionally left to preserve the state of such historical works.
