

Charles Darwin's *The Origin of Species*, published on 24 November 1859, is a work of scientific literature which is considered to be the foundation of evolutionary biology. Its full title was *On the Origin of Species by Means of Natural Selection, or the Preservation of Favoured Races in the Struggle for Life*. For the sixth edition of 1872, the short title was changed to *The Origin of Species*. Darwin's book introduced the scientific theory that populations evolve over the course of generations through a process of natural selection. It presented a body of evidence that the diversity of life arose by common descent through a branching pattern of evolution. Darwin included evidence that he had gathered on the Beagle expedition in the 1830s and his subsequent findings from research, correspondence, and experimentation.
